EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 288
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

A developer is creating an Amazon DynamoDB table by using the AWS CLI. The DynamoDB table must use server-side encryption with an AWS owned encryption key.

How should the developer create the DynamoDB table to meet these requirements?

A. Create an AWS Key Management Service (AWS KMS) customer managed key. Provide the key's Amazon Resource Name (ARN) in the KMSMasterKeyId parameter during creation of the DynamoDB table.

B. Create an AWS Key Management Service (AWS KMS) AWS managed key. Provide the key's Amazon Resource Name (ARN) in the KMSMasterKeyId parameter during creation of the DynamoDB table.

C. Create an AWS owned key. Provide the key's Amazon Resource Name (ARN) in the KMSMasterKeyId parameter during creation of the DynamoDB table.

D. Create the DynamoDB table with the default encryption options.

Selected Answer: D

When creating a DynamoDB table, if no specific encryption options are provided, it uses the default encryption setting which is server-side encryption with AWS managed keys (SSE with AWS owned key). This option does not require specifying a key ARN in the creation process, making it the simplest and most straightforward way to ensure data at rest is encrypted using keys managed by AWS.
