EXAM AWS CERTIFIED AI PRACTITIONER AIF-C01 TOPIC 1 QUESTION 262 DI...

Exam question from Amazon's AWS Certified AI Practitioner AIF-C01

Question #: 262

Topic #: 1

[All AWS Certified AI Practitioner AIF-C01 Questions]

A company is working on a large language model (LLM) and noticed that the LLM's outputs are not as diverse as expected.

Which parameter should the company adjust?

A. Temperature

B. Batch size

C. Learning rate

D. Optimizer type

Selected Answer: A

Temperature controls the randomness or creativity of a language model's output.

upvoted 1 times

Selected Answer: A

• A. Temperature
✔️ This controls the randomness of the model's output during text generation.
• Higher temperature (e.g., 0.8–1.0) → more randomness and diversity.
• Lower temperature (e.g., 0.2–0.5) → more deterministic, conservative output.
→ Directly affects diversity.
• B. Batch size
Affects training efficiency and stability, not creativity of generated text.
❌ Irrelevant.
• C. Learning rate
Controls how fast the model updates weights during training. It's about model convergence, not generation randomness.
❌ Not related.
• D. Optimizer type
Chooses the algorithm (e.g., Adam, SGD) for weight updates. Doesn't control output diversity at inference.
❌ Not relevant.

✅ Correct answer: A. Temperature
