EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 291
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

A data visualization company wants to strengthen the security of its core applications. The applications are deployed on AWS across its development, staging, pre-production, and production environments. The company needs to encrypt all of its stored sensitive credentials. The sensitive credentials need to be automatically rotated. A version of the sensitive credentials need to be stored for each environment.

Which solution will meet these requirements in the MOST operationally efficient way?

A. Configure AWS Secrets Manager versions to store different copies of the same credentials across multiple environments.

B. Create a new parameter version in AWS Systems Manager Parameter Store for each environment. Store the environment-specific credentials in the parameter version.

C. Configure the environment variables in the application code. Use different names for each environment type.

D. Configure AWS Secrets Manager to create a new secret for each environment type. Store the environment-specific credentials in the secret.

Selected Answer: D

D. Configure AWS Secrets Manager to create a new secret for each environment type. Store the environment-specific credentials in the secret.

AWS Secrets Manager supports the encryption of secrets (including sensitive credentials) and allows for automatic rotation of these secrets. By creating a new secret for each environment (development, staging, pre-production, and production), you can manage and access the environment-specific credentials securely. This approach facilitates operational efficiency by leveraging AWS Secrets Manager's built-in capabilities for encryption and rotation, without the need for manual intervention or complex configurations. Secrets Manager also provides a straightforward way to retrieve the correct version of the credentials for each specific environment, simplifying the management of sensitive data across different stages of application deployment.
