EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 306
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

A developer is building an application on AWS. The application includes an AWS Lambda function that processes messages from an Amazon Simple Queue Service (Amazon SQS) queue.

The Lambda function sometimes fails or times out. The developer needs to figure out why the Lambda function fails to process some messages.

Which solution will meet these requirements with the LEAST operational overhead?

A. Increase the maximum timeout of the Lambda function to 15 minutes. Check the AWS CloudTrail event history for error details.

B. Increase the visibility timeout of the SQS queue. Check logs in Amazon CloudWatch Logs for error details.

C. Create a dead-letter queue. Configure the Lambda function to send the failed messages to the dead-letter queue.

D. Create an Amazon DynamoDB table. Update the Lambda function to send the failed messages to the DynamoDB table.

B, the question is asking how the developer can figure out the issue. it is not asking about where to put the failed messages to.
