EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 308
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

A company needs to deploy all its cloud resources by using AWS CloudFormation templates. A developer must create an Amazon Simple Notification Service (Amazon SNS) automatic notification to help enforce this rule. The developer creates an SNS topic and subscribes the email address of the company's security team to the SNS topic.

The security team must receive a notification immediately if an IAM role is created without the use of CloudFormation.

Which solution will meet this requirement?

A. Create an AWS Lambda function to filter events from CloudTrail if a role was created without CloudFormation. Configure the Lambda function to publish to the SNS topic. Create an Amazon EventBridge schedule to invoke the Lambda function every 15 minutes.

B. Create an AWS Fargate task in Amazon Elastic Container Service (Amazon ECS) to filter events from CloudTrail if a role was created without CloudFormation. Configure the Fargate task to publish to the SNS topic. Create an Amazon EventBridge schedule to run the Fargate task every 15 minutes.

C. Launch an Amazon EC2 instance that includes a script to filter events from CloudTrail if a role was created without CloudFormation. Configure the script to publish to the SNS topic. Create a cron job to run the script on tile EC2 instance every 15 minutes.

D. Create an Amazon EventBridge rule to filter events from CloudTrail if a role was created without CloudFormation. Specify the SNS topic as the target of the EventBridge rule.

Selected Answer: D

(ABC) eliminated. every 15 minutes is not immediate notification.
(D) is correct.

Amazon EventBridge rule - specifies what EventBridge does with the events delivered to each event bus. A rule specifies which events to send to which targets for processing. A single rule can send an event to multiple targets, which then run in parallel. There are two types of rules: rules that match on event data as events are delivered, and rules that run on a defined schedule. In addition, certain AWS services may create and manage rules in your account as well.

Amazon EventBridge rule that match on event data - match against incoming events based on event data criteria,an event pattern. An event pattern defines the event structure and the fields that a rule matches. If an event matches the criteria defined in the event pattern, EventBridge sends it to the target(s) you specify.

Selected Answer: D

El desarrollador debe crear una regla de Amazon EventBridge para filtrar eventos de CloudTrail si se crea un rol sin el uso de CloudFormation. Luego, debe especificar el tema de SNS como destino de la regla de EventBridge. Esto permitirá que el equipo de seguridad reciba una notificación inmediata a través del tema de SNS cuando se cree una función de IAM sin el uso de CloudFormation.
