EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 324
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

A developer is building a containerized application on AWS. The application communicates with a third-party service by using API keys. The developer needs a secure way to store the API keys and pass the API keys to the containerized application.

Which solutions will meet these requirements? (Choose two.)

A. Store the API keys as a SecureString parameter in AWS Systems Manager Parameter Store. Grant the application access to retrieve the value from Parameter Store.

B. Store the API keys in AWS CloudFormation templates by using base64 encoding. Pass the API keys to the application through container definition environment variables.

C. Add a new AWS CloudFormation parameter to the CloudFormation template. Pass the API keys to the application by using the container definition environment variables.

D. Embed the API keys in the application. Build the container image on-premises. Upload the container image to Amazon Elastic Container Registry (Amazon ECR).

E. Store the API keys as a SecretString parameter in AWS Secrets Manager. Grant the application access to retrieve the value from Secrets Manager.
