EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 328
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

A developer is working on an ecommerce platform that communicates with several third-party payment processing APIs. The third-party payment services do not provide a test environment.

The developer needs to validate the ecommerce platform's integration with the third-party payment processing APIs. The developer must test the API integration code without invoking the third-party payment processing APIs.

Which solution will meet these requirements?

A. Set up an Amazon API Gateway REST API with a gateway response configured for status code 200. Add response templates that contain sample responses captured from the real third-party API.

B. Set up an AWS AppSync GraphQL API with a data source configured for each third-party API. Specify an integration type of Mock. Configure integration responses by using sample responses captured from the real third-party API.

C. Create an AWS Lambda function for each third-party API. Embed responses captured from the real third-party API. Configure Amazon Route 53 Resolver with an inbound endpoint for each Lambda function's Amazon Resource Name (ARN).

D. Set up an Amazon API Gateway REST API for each third-party API. Specify an integration request type of Mock. Configure integration responses by using sample responses captured from the real

third-party API.

I will go with A. You can manage all mock responses within a single API Gateway, simplifying the setup and reducing costs.

Selected Answer: D

A. Response Templates for Status Code 200: While API Gateway supports response templates, simply configuring a 200 status code doesn't simulate the specific responses expected from the third-party APIs. The developer needs to define more detailed response structures to effectively test the integration logic.

Selected Answer: A

A. Configure una API REST de Amazon API Gateway con una respuesta de puerta de enlace configurada para el código de estado 200. Agregue plantillas de respuesta que contengan respuestas de muestra capturadas de la API real de terceros.

Al configurar una API REST de Amazon API Gateway con una respuesta de puerta de enlace configurada para el código de estado 200, el desarrollador puede simular las respuestas de las API de procesamiento de pagos de terceros sin invocar realmente las API reales. Al agregar plantillas de respuesta que contengan respuestas de muestra capturadas de la API real de terceros, el desarrollador puede validar la integración de la plataforma de comercio electrónico con las API de procesamiento de pagos de terceros sin tener que interactuar directamente con las API reales.
