EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 397
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

A developer has a continuous integration and continuous delivery (CI/CD) pipeline that uses AWS CodeArtifact and AWS CodeBuild. The build artifacts are between 0.5 GB and 1.5 GB in size. The builds happen frequently and retrieve many dependencies from CodeArtifact each time.

The builds have been slow because of the time it takes to transfer dependencies. The developer needs to improve build performance by reducing the number of dependencies that are retrieved for each build.

Which solution will meet this requirement?

A. Specify an Amazon S3 cache in CodeBuild. Add the S3 cache folder path to the buildspec.yaml file for the build project.

B. Specify a local cache in CodeBuild. Add the CodeArtifact repository name to the buildspec.yaml file for the build project.

C. Specify a local cache in CodeBuild. Add the cache folder path to the buildspec.yaml file for the build project.

D. Retrieve the buildspec.yaml file directly from CodeArtifact. Add the CodeArtifact repository name to the buildspec.yaml file for the build project.

Selected Answer: C

Explanation

Using a local cache in CodeBuild allows you to cache dependencies locally on the build host, which can significantly reduce the time it takes to retrieve dependencies during subsequent builds.

Selected Answer: C

update buildspec.yaml

version: 0.2

phases:
install:
commands:
- echo Installing dependencies...
- pip install -r requirements.txt
build:
commands:
- echo Build started on `date`
- echo Compiling the Python code...
- python setup.py build

cache:
paths:
- '/root/.cache/pip/**/*' # dependencies cache
