EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 463
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

An application is experiencing performance issues based on increased demand. This increased demand is on read-only historical records pulled from an Amazon RDS-hosted database with custom views and queries. A developer must improve performance without changing the database structure.

Which approach will improve performance and MINIMIZE management overhead?

A. Deploy Amazon DynamoDB, move all the data, and point to DynamoDB.

B. Deploy Amazon ElastiCache (Redis OSS) and cache the data for the application.

C. Deploy Memcached on Amazon EC2 and cache the data for the application.

D. Deploy Amazon DynamoDB Accelerator (DAX) on Amazon RDS to improve cache performance.

Selected Answer: B

B : Redis . Fully manged, and does not require DB structure to be changed, like moving to Dynamo would.

C : Memcache could also do the job , but honestly , hosting on EC2 adds managment overhead , and is by nature a single point of failure
