EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 490
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

A company hosts applications on premises. The on-premises servers generate audit logs that are available through an HTTP endpoint.

The company needs an automated solution to regularly ingest and store large volumes of audit data from the on-premises servers. The company also needs to perform queries on the audit data.

Which solution will meet these requirements in the MOST operationally efficient way?

A. Export the audit logs. Upload the logs to Amazon S3. Import the logs to an Amazon RDS DB instance.

B. Create an AWS Lambda function to call the HTTP endpoint to fetch audit logs. Configure an Amazon EventBridge scheduled rule to invoke the Lambda function. Configure the Lambda function to push the logs to AWS CloudTrail Lake.

C. Use AWS DataSync to transfer audit logs to an Amazon S3 bucket. Load the logs into an Amazon S3 bucket. Use Amazon Athena to query the bucket.

D. Install the Amazon CloudWatch agent on the on-premises servers. Give the agent the ability to push audit logs to CloudWatch. Use CloudWatch Insights to query the logs.

Selected Answer: D

Operationally efficient is to use the program specifically designed for this: the CloudWatch Agent, which ships log files to the cloud. https://docs.aws.amazon.com/AmazonCloudWatch/latest/monitoring/Install-CloudWatch-Agent.html

Is AWS trying to evangelize CloudTrail Lake here? Maybe. But I can't imagine pulling logs from HTTP on-premises endpoints... Operationally, it just doesn't make sense to me.

Selected Answer: C

AWS DataSync is an online data movement and discovery service that simplifies and accelerates data migrations to AWS as well as moving data to and from on-premises storage, edge locations, other cloud providers, and AWS Storage services.

https://docs.aws.amazon.com/datasync/latest/userguide/create-s3-location.html

Selected Answer: B

una función Lambda programada mediante EventBridge, se puede invocar periódicamente para llamar al endpoint HTTP y extraer los logs, sin tener que instalar nada en los servidores on premises. Con CLoudtrail lake tampoco tienes que instalar nada
