EXAM AWS CERTIFIED AI PRACTITIONER AIF-C01 TOPIC 1 QUESTION 7 DISC...

Exam question from Amazon's AWS Certified AI Practitioner AIF-C01
Question #: 7
Topic #: 1
[All AWS Certified AI Practitioner AIF-C01 Questions]

A company is using domain-specific models. The company wants to avoid creating new models from the beginning. The company instead wants to adapt pre-trained models to create models for new, related tasks.
Which ML strategy meets these requirements?

A. Increase the number of epochs.

B. Use transfer learning.

C. Decrease the number of epochs.

D. Use unsupervised learning.

Selected Answer: B

Transfer learning allows you to leverage pre-trained models (which have already been trained on large datasets) and adapt them for new, related tasks with minimal additional training. This strategy is highly efficient because it saves time and computational resources compared to training a model from scratch. By fine-tuning the pre-trained model on a smaller dataset specific to the new task, the model can learn task-specific features while maintaining the general knowledge it acquired during its initial training.

Selected Answer: B

A) Increase the number of epochs (not correct) Increasing epochs just trains a model longer and does not adapt a pre-trained model to a new task

B) Use transfer learning (is correct) Transfer learning takes an existing pre-trained model and fine-tunes it for a new but related task, avoiding training from scratch

C) Decrease the number of epochs (not correct) Reducing epochs limits training and does not help reuse or adapt pre-trained models

D) Use unsupervised learning (not correct) Unsupervised learning finds patterns without labeled data and does not specifically adapt pre-trained models for new tasks

Selected Answer: B

Transfer learning lets you adapt pre-trained models to new tasks without starting from scratch, saving time and resources.

Selected Answer: B

It is clearly B. The number of epochs is not related to that issue while the (un)supervised learning is used for training a new model, which is totally different from adapting a pre-trained model to create a new model.

Selected Answer: B

B: Use transfer learning.

Explanation:
Transfer learning is a machine learning strategy that leverages pre-trained models and adapts them to new but related tasks. This allows the company to avoid building models from scratch, significantly reducing the time and resources required for training. By fine-tuning the pre-trained model on domain-specific data, the company can achieve high performance for the new task without starting from the beginning.

Selected Answer: B

Transfer learning involves taking a pre-trained model, which has been trained on a large dataset, and adapting it to a new, related task. This approach offers several advantages:

Selected Answer: B

TL where a model pre-trained on one task is fine-tuned for a new, related task.
