EXAM AWS CERTIFIED AI PRACTITIONER AIF-C01 TOPIC 1 QUESTION 25 DIS...

Exam question from Amazon's AWS Certified AI Practitioner AIF-C01

Question #: 25

Topic #: 1

[All AWS Certified AI Practitioner AIF-C01 Questions]

A company wants to use a large language model (LLM) on Amazon Bedrock for sentiment analysis. The company wants to classify the sentiment of text passages as positive or negative.

Which prompt engineering strategy meets these requirements?

A. Provide examples of text passages with corresponding positive or negative labels in the prompt followed by the new text passage to be classified.

B. Provide a detailed explanation of sentiment analysis and how LLMs work in the prompt.

C. Provide the new text passage to be classified without any additional context or examples.

D. Provide the new text passage with a few examples of unrelated tasks, such as text summarization or question answering.

Selected Answer: A

This approach is known as few-shot prompting, where you include a few labeled examples to guide the model on how to classify sentiment.

Selected Answer: A

Provide examples of text passages with corresponding positive or negative labels in the prompt followed by the new text passage to be classified: This approach uses few-shot learning, where you give the model clear examples of text passages labeled with sentiment (positive or negative). By providing these examples in the prompt, the model is better able to understand the task and generalize it to classify the new text passage correctly. This is a common and effective strategy for tasks like sentiment analysis.

Selected Answer: A

A: Provide examples of text passages with corresponding positive or negative labels in the prompt followed by the new text passage to be classified.

Explanation:
This strategy is known as few-shot prompting, where the prompt includes a few examples of labeled data (text passages with positive or negative sentiment) before asking the model to classify the new text passage. This helps the large language model (LLM) understand the task and align its output with the desired format.

Why not the other options?
B: Provide a detailed explanation of sentiment analysis and how LLMs work in the prompt:
Explaining the concept of sentiment analysis is unnecessary for the model, as it does not improve the model's ability to classify text.
C: Provide the new text passage to be classified without any additional context or examples:
Without examples, the LLM might not correctly infer the task or format of the output, leading to inconsistent or incorrect results.

Gianiluca 1 year, 3 months ago

Selected Answer: A

This approach uses few-shot learning, which is highly effective with large language models. By providing examples of text passages with their corresponding sentiment classifications, the LLM learns the context and pattern needed to classify the new passage.

upvoted 1 times

jove 1 year, 4 months ago

Selected Answer: A

Explanation:
By providing examples of text passages along with their corresponding sentiment labels (positive or negative), the model can learn from these examples how to classify the sentiment of the new text passage effectively
