Selected Answer: D

Amazon SageMaker Clarify provides functionality to detect and identify potential bias in data both before and after training, helping teams uncover imbalances in datasets that might lead to biased model predictions. This is essential for ensuring fairness and compliance, especially in sensitive applications.

Why Not the Other Options?
A. Integrates a Retrieval Augmented Generation (RAG) workflow: RAG workflows are used for combining retrieved documents with model outputs, typically in language models, but this is not a function of SageMaker Clarify.
B. Monitors the quality of ML models in production: Monitoring model quality in production is handled by SageMaker Model Monitor, not SageMaker Clarify.
C. Documents critical details about ML models: This functionality is part of Amazon SageMaker Model Cards, which documents model details for transparency and compliance.
