EXAM AWS CERTIFIED AI PRACTITIONER AIF-C01 TOPIC 1 QUESTION 49 DIS...

Exam question from Amazon's AWS Certified AI Practitioner AIF-C01
Question #: 49
Topic #: 1
[All AWS Certified AI Practitioner AIF-C01 Questions]

A loan company is building a generative AI-based solution to offer new applicants discounts based on specific business criteria. The company wants to build and use an AI model responsibly to minimize bias that could negatively affect some customers.
Which actions should the company take to meet these requirements? (Choose two.)

A. Detect imbalances or disparities in the data.

B. Ensure that the model runs frequently.

C. Evaluate the model's behavior so that the company can provide transparency to stakeholders.

D. Use the Recall-Oriented Understudy for Gisting Evaluation (ROUGE) technique to ensure that the model is 100% accurate.

E. Ensure that the model's inference time is within the accepted limits.

Selected Answer: AC

A. Detect imbalances or disparities in the data C. Evaluate the model's behavior so that the company can provide transparency to stakeholders

Why:

Detecting imbalances or disparities in the data is crucial because:
It helps identify potential bias in training data before it affects model decisions
It ensures fair treatment across different customer segments
It aligns with responsible AI development practices
Evaluating model behavior for transparency is important because:
It allows stakeholders to understand how decisions are made
It helps demonstrate compliance with fair lending regulations
It enables the company to justify decisions to customers and regulators

below incorrect because:

B (frequent model runs) doesn't address bias or responsible AI
D (ROUGE technique) is for text summarization evaluation, not lending decisions
E (inference time) is about performance, not fairness or responsibility

The correct answers are A and C:

A: Detect imbalances or disparities in the data
C: Evaluate the model's behavior so that the company can provide transparency to stakeholders

Let's analyze why these are correct:

Detect imbalances or disparities in the data (A):

Essential for identifying potential sources of bias in training data
Helps ensure fair representation across different customer groups
Allows for correction of data bias before model training
Critical for responsible AI development in financial services

Evaluate model's behavior for transparency (C):

Enables stakeholder understanding of model decisions
Helps identify potential discriminatory patterns
Supports regulatory compliance
Essential for maintaining accountability

Selected Answer: AC

A. Detect imbalances or disparities in the data: Bias often originates from imbalanced or biased data. By detecting and addressing any imbalances or disparities in the data (such as certain groups being overrepresented or underrepresented), the company can ensure that the model treats all applicants fairly, regardless of their background. This helps to minimize potential bias that could negatively affect certain customers.

C. Evaluate the model's behavior so that the company can provide transparency to stakeholders: Evaluating the model's behavior is crucial for responsible AI usage. By assessing how the model performs across different customer groups, the company can ensure that the model is not inadvertently discriminating or providing unfair treatment. Transparency about the model's decision-making process also builds trust with stakeholders and customers.
