Exam question from Amazon's AWS Certified AI Practitioner AIF-C01

Question #: 134

Topic #: 1

[All AWS Certified AI Practitioner AIF-C01 Questions]

A company wants to keep its foundation model (FM) relevant by using the most recent data. The company wants to implement a model training strategy that includes regular updates to the FM.

Which solution meets these requirements?

A. Batch learning

B. Continuous pre-training

C. Static training

D. Latent training

Selected Answer: B

Answer: B. Continuous pre-training

To keep a foundation model (FM) updated with the most recent data on a regular basis, you need a training approach that continually integrates new information. Continuous pre-training fits this requirement because it periodically (or even continuously) retrains or fine-tunes the model with the latest data, ensuring relevance and improved performance.

Here's why the other options are less suitable:

A. Batch learning: Trains in large, discrete batches and may introduce significant delays between training cycles, potentially causing the model to become stale.
C. Static training: Trains the model once and does not update it with new data, leading to outdated predictions.
D. Latent training: Not a standard industry term or recognized strategy for regularly updating foundation models.

Selected Answer: B

This strategy involves regularly updating the foundation model with new data, ensuring the model stays relevant and accurate over time. It allows for the continuous improvement of the model as new information becomes available.

Selected Answer: B

To keep a foundation model (FM) relevant by using the most recent data and implementing a model training strategy that includes regular updates, the best solution is Continuous pre-training. This approach involves continuously updating the model with new data, ensuring that it remains current and effective
